Should Know

Vaginitis is an inflammation of a woman’s vagina. It is one of the most common health problems in the United States. STDs can be prevented to remember this:

- Protect yourself against STDs...
- Ask about your partner’s sexual history and whether he or she has had STDs...
- How you can find out if you are infected with any of these STDs...
- Your health care provider will help you take the right steps to identify and treat any infections you may have...
- Neither is 100% foolproof, but they do offer protection against STDs. For women, a Contraceptive... 

How to Do You Find Out If You Have Any Sexually Transmitted Diseases

Most STDs are easily treated. The earlier a person seeks treatment and is cured, the better. If left untreated, STDs can cause various diseases which include pneumonia, persistent pulmonary hypertension of the newborn, brain and nervous system destruction, eye and joint damage, and skin rashes. These diseases will do the least harm to your health if they are caught early. The best protection against STDs, use a condom every time you have sex. There are many people who are...
